

# MaxiDry® – Controlled performance™

Non Slip Grip Technology. Nitrile on a seamless nylon liner.

56-530

## ErgoTech® technology platform

**Ultra lightweight** - synthetic coating combined with an industry leading super light seamless knit liner provides excellent comfort, sensitivity, fit and dexterity.

**Locking cuff** - ensures the glove does not slip off the hand: an exclusive elasticated support in the wrist area provides a “locking” effect for a close and snug fit

## GripTech® technology platform

Our micro-cup non-slip grip finish allows for a controlled and superior grip in oily and wet applications. The non-slip grip is only applied where it is actually needed - in the palm area - to ensure flexibility isn't compromised.

## LiquiTech® technology platform

**Liquid repellence** - splash resistance to chemicals is delivered through the LiquiTech® technology platform. Excellent resistance to hydrocarbons and caustics.

## Hand Care® technology platform

**Skin friendly** - The well-being technology eliminates all traces of process chemical and odours. MaxiDry® is “skin friendly” and certified to the Oeko-Tex 100® standard, which means the gloves are **certified** that they do not contain any harmful/carcinogenic solvents.

## Sanitized technology platform

**REACH compliant** - All ingredients used in the manufacturing and construction of MaxiDry® is compliant with REACH - “Registration, Evaluation, Authorisation and Restriction of Chemical substances”. REACH is a new EU directive with the key aim to provide high levels of protection to human health & environment.

Built-in anti-microbial & odour protection

# MaxiDry® LR — *Controlled performance™*

Non Slip Grip Technology. Nitrile on a seamless nylon liner with Lycra®

## WHY IS ATG INTRODUCING THIS PRODUCT?

Within the manufacturing sector industry workers hands are exposed to aliphatic hydrocarbons (oils). Oil in its purest form is not perceived to be a hazardous chemical. Indeed many of us even consume oils on a daily basis (olive oil). So what is the problem?

Firstly, the majority of aliphatic hydrocarbons used in industry are recycled and contain ingredients that are carcinogenic. Exposure to carcinogens may increase the risk of getting cancer by altering the cellular metabolism or damaging DNA directly in cells.

Secondly, the lack of grip offered by the gloves used in the market place today, require workers to exert a disproportionate level of force to grip

the items they handle. Over a period of time this increases the risk of carpel tunnel syndrome.

Thirdly, grip is and should be seen as a fundamental safety feature. Investing in the appropriate level of grip can avoid the need for gloves that contain expensive cut resistance fibers. Good grip ensures less slip which in turn means fewer accidents.

Finally, there is no lightweight product on the market today able to offer oil grip, chemical protection and comfort all in one. So what do people do? The majority opt for chemical resistant products which provide low comfort and ergonomics making it difficult and slower to get the job done.

REACH is a new European Community Regulation on chemicals and their safe use (EC 1907/2006). It deals with the Registration, Evaluation, Authorisation and Restriction of Chemical substances. The new law entered into force on 1 June 2007.

The aim of REACH is to improve the protection of human health and the environment through the better and earlier identification of the intrinsic properties of chemical substances. The benefits of the REACH system will come gradually, as more and more substances are phased into REACH.

ATG is at the forefront of this curve being the only manufacture within the gloves business to

have fully certified manufacturing facilities. It requires for full information to be gathered on the properties of their chemical substances, which allow their safe handling. This is registered in a central database run by the European Chemicals Agency (ECHA) in Helsinki. The agency acts as the central point in the REACH system.

REACH also calls for the progressive substitution of the dangerous chemicals when suitable alternatives have been identified. ATG is also active with this as part of its ISO14001 certification and commitment. n
